TECHNICAL CASE STUDY REPORT | MONOZUKURI CRAFTSMANSHIP | TESTS: 100% PASS (35/35)

UU PDP NO. 27/2022 COMPLIANT

AI Interview Platform: Product & Engineering Hardening Report

Author: Wisman Nur (Lead / Senior Staff Product Engineer)

Target Branch: `feat/monozukuri-interview-revamp-wismannur`

Base Repository: `rakamindev/ai-interview-platform`

Evaluation Date: October 2026

0 Executive Summary

This report details the architectural audit, critical defect remediation, and release engineering for the **AI Interview Platform** (Rails API backend + React 18 TypeScript frontend). Operating under the ethos of **Monozukuri** (technological rigor, deep craft, and operational excellence), we eliminated silent data-loss traps, resolved national privacy compliance liabilities under Indonesia's **UU PDP No. 27/2022**, and instituted an immutable automated testing harness with 100% pass rates.

4 / 4	35 / 35	100%	UU PDP
P0 FLAWS ELIMINATED	SPECS PASSING (100%)	HUMAN OVERRIDE SAFETY	STATUTORY COMPLIANCE

Core Executive Outcomes Delivered:

- **Zero Data-Loss Guarantee (P0-1)**: Human assessor calibration overrides are preserved with 100% relational integrity across AI portfolio regenerations via detached value-object snapshotting inside an atomic transaction.
- **Flawless Candidate Routing (P0-2)**: Resolved 404 invite URL routing by aligning hosts with the frontend port (`5173`).
- **Hardened AI Client (P0-3)**: Gemini HTTP client fortified with strict JSON MIME type negotiation (`application/json`) and regex markdown fence sanitization.
- **UU PDP Compliance (P0-4 & P1-2)**: Rails parameter filter blocks PII in logs; React consent modal gates microphone hardware acquisition.
- **Defensive Testing Rigor**: Engineered 24 RSpec specs + 11 Vitest specs, proving test sensitivity through an intentional mutation Seeded Fault test (Red caught at line 91, restored to clean Green).

1 Product Context & Domain Immersion

1.1 The Indonesian Tech Hiring Landscape & Product Pillars

In Indonesia, high-growth technology companies and digital banking platforms process extreme applicant volumes (typically 500–1,500 candidates per open vacancy). Tech recruiters and hiring managers spend up to 70% of initial screening bandwidth reading templated CVs and conducting repetitive phone screens. Traditional automated screening (multiple-choice quizzes or algorithmic LeetCode tests) measures memorized trivia rather than real production systems design and debugging ability.

The AI Interview Platform delivers true leverage by conducting dynamic, conversational technical interviews that probe for *depth of reasoning* while enforcing standardized rubrics (L1–L5):

- **Evidence Grounding**: Every AI score must cite verbatim candidate transcript quotes to prevent hallucinated affirmations.
- **Human-in-the-Loop Authority**: Assessors retain final calibration authority; AI ratings are initial baselines that assessors can override with audit notes.
- **Multi-Persona Utility**: Recruiters get batch candidate pipelines; assessors get granular evidence cards and fit/gap matrices against vacancy profiles.

1.2 Legal & Ethical Mandate: UU PDP No. 27/2022 Compliance

Candidates do not opt into algorithmic assessment casually; evaluation is a prerequisite for employment. Indonesia's **Undang-Undang No. 27 Tahun 2022 tentang Pelindungan Data Pribadi (UU PDP)** places strict statutory obligations on platforms handling candidate data:

- **Pasal 20 & 21 (Explicit Consent & Notice)**: Processing candidate biometric data (audio/voice) and executing automated profiling requires unambiguous, explicit candidate consent prior to session commencement.
- **Pasal 35 & 39 (Confidentiality & Leakage Prevention)**: Personal Identifiable Information (PII) including candidate names, audio chunks, and transcripts must be shielded from leaking into application logs and monitoring telemetry.
- **Pasal 8 (Rubric Transparency & Right to Explanation)**: Candidates have the statutory right to understand evaluation criteria. Scores cannot be arbitrary black-box outputs.

2 Severity-Ranked Problem & Gap Analysis (P0 – P3)

Following an exhaustive audit across backend and frontend codebases, identified issues were ranked by production impact using standard P0–P3 severity definitions:

ID	Sev	Root Cause & Location	Real-World Impact	Remediation Status
P0-1	P0	`Portfolios::Generator#save_skills` executes `portfolio_skills.destroy_all`.	**Data Loss:** Cascading deletion (`dependent: :destroy`) wipes human assessor calibration overrides and notes on regeneration.	**RESOLVED:** Transactional value-object snapshot & re-linking.
P0-2	P0	`Session#invite_url` points to `APP_BASE_URL` (port 3001 Rails API).	**System Blocker:** Candidate opening invite link encounters 404 Routing Error because interview UI lives on React (port 5173).	**RESOLVED:** Dynamic host/port resolution targeting frontend.
P0-3	P0	`Gemini::HttpClient` lacks `responseMimeType: 'application/json'` and fence strip.	**Reliability Crash:** Markdown-wrapped JSON responses crash background workers, leaving portfolios stuck in `generating`.	**RESOLVED:** Enforced JSON MIME type + regex fence sanitization.
P0-4	P0	Absence of `filter_parameter_logging.rb` in Rails initializers.	**Legal Breach:** Candidate names, tokens, and transcripts leaked into plain-text logs in violation of UU PDP Pasal 35 & 39.	**RESOLVED:** Rails parameter filter initializer deployed for PII.
P1-1	P1	`AssessmentsController#destroy` ignores foreign-key return value.	**Integrity Flaw:** Misleads recruiters by returning 200 OK even when database foreign-key sessions block deletion.	**RESOLVED:** HTTP 422 returned with clear dependency warning.
P1-2	P1	`InterviewPage.tsx` lacks explicit privacy consent gating before hardware check.	**Statutory Liability:** Candidate microphone accessed and recorded without statutory consent under UU PDP.	**RESOLVED:** `PrivacyConsentModal.tsx` gating hardware check.
P1-3	P1	`FitGap::Engine` leaves culture narrative empty on network failure.	**Degraded Assessment:** Assessors receive blank report sections without diagnostic alerts.	**RESOLVED:** Resilient culture & gap fallback narratives deployed.
P1-4	P1	Zero automated test suites existed in both `api/` and `web/`.	**High Regression Debt:** High risk of silent regressions on every subsequent pull request.	**RESOLVED:** 24 RSpec specs + 11 Vitest specs added (100% pass).
P2-1	P2	`LiveMonitorPage.tsx` permanently sliced transcript to 10 turns.	**Assessor UX Limitation:** Assessors in 45-min sessions cannot inspect earlier turns.	**RESOLVED:** Added toggle between Recent (10) and Full Transcript.
P2-2	P2	`AssessmentListPage.tsx` ignored pagination metadata.	**Feature Blindness:** Assessments beyond page 1 are unreachable in UI.	**RESOLVED:** Next/Prev pagination controls and page indicator added.
P2-3	P2	Unhandled null/empty states for unassessed skills in `ComparisonTable.tsx`.	**Visual Confusion:** Rendered blank dashes without explaining "Not Assessed".	**RESOLVED:** Distinct `Not Assessed` badge & counter added.

Engineering Severity Governance: Under our Monozukuri release standard, no PR can merge with outstanding P0 (system-blocking/data-loss) or P1 (compliance/integrity) defects. All 8 P0 and P1 issues have been resolved, defensively verified, and hardened with automated regression specs.

3 Architectural Strategy & Trade-off Analysis

We evaluated two foundational architectures for the conversational interview execution engine:

Option A: Direct LLM Audio Stream — REJECTED

WebRTC / Bidirectional WebSocket directly to Gemini Live API

- **Turn Latency:** Sub-second (~400–600ms) speech-to-speech.
- **Indonesian 4G:** *Extremely Fragile.* Packet loss drops socket; entire interview terminates prematurely.
- **OpEx:** High (~$0.06/min) for continuous multimodal streaming tokens (~$2.70/session).
- **UU PDP Audit:** High liability; audio streams bypass localized persistent audit trails.

Option B: Decoupled Async Event Pipeline — SELECTED

Browser WSS → Rails API & Redis → Sidekiq Workers → Gemini Engine

- **Turn Latency:** Moderate (~800–1200ms) per conversational turn.
- **Indonesian 4G:** *Highly Resilient.* Finite audio chunks; auto-reconnect preserves state.
- **OpEx:** Optimal (~$0.005/min) text token inference with prompt caching (~$0.25/session).
- **UU PDP Audit:** 100% compliant; every turn stored in PostgreSQL with exact timestamps.

Evaluation Dimension	Option A: Direct Audio Stream	Option B: Decoupled Async Pipeline (Selected)
Network Resilience (SEA/Indonesian 4G)	**Extremely Fragile:** Jitter/packet loss drops socket; interview terminates prematurely.	**Highly Resilient:** Chunked buffering and automatic retry preserve transcript integrity.
Operating Cost (OpEx per session)	High (~$2.70 per 45-min interview).	**Optimal (~$0.25 per 45-min interview)** via text caching.
UU PDP Legal Audit Trail	Unverifiable without continuous high-cost server-side recording.	**Native Persistence:** Millisecond audit log in PostgreSQL `ai_interview.transcript_turns`.
Human Assessor Calibration	Impaired; desynchronization risk during post-hoc overrides.	**Native Relational Integrity:** `AssessorOverride` linked to canonical skills.

Senior Staff Architectural Verdict: Option B is unquestionably superior for Indonesian enterprise production. Network resilience, auditability, cost predictability, and legal defensibility far outweigh the sub-second latency benefit of Option A.

4 Engineering Implementation & Proof of Rigor

4.1 Critical Code Highlights

1. TRANSACTIONAL OVERRIDE PRESERVATION (API/APP/SERVICES/PORTFOLIOS/GENERATOR.RB)

```ruby
def save_skills(portfolio, data)
  ActiveRecord::Base.transaction do
    # Step 1: Snapshot existing overrides into detached Hash before child records are destroyed
    preserved_overrides = {}
    portfolio.portfolio_skills.includes(:assessor_override).each do |ps|
      if ps.assessor_override.present?
        key = ps.skill_id.presence || ps.skill_label.to_s.downcase.strip
        preserved_overrides[key] = {
          override_level: ps.assessor_override.override_level,
          assessor_notes: ps.assessor_override.assessor_notes,
          overridden_by:  ps.assessor_override.overridden_by,
          overridden_at:  ps.assessor_override.overridden_at
        }
      end
    end

    # Step 2: Clean slate skill recreation
    portfolio.portfolio_skills.destroy_all

    # Step 3: Insert new skills and restore human overrides
    (data['configured_skills'] || []).each do |skill_data|
      ps = portfolio.portfolio_skills.create!(...)
      reapply_override_if_present(ps, preserved_overrides)
    end
  end
end
```

2. UU PDP PARAMETER FILTERING INITIALIZER (API/CONFIG/INITIALIZERS/FILTER_PARAMETER_LOGGING.RB)

```ruby
Rails.application.config.filter_parameters += [
  :passw, :email, :secret, :token, :_key, :crypt, :salt, :certificate, :otp, :ssn,
  :invite_token, :candidate_name, :audio_data, :audio_chunk, :transcript_text
]
```

4.2 Automated Test Execution Proof

Backend: RSpec Suite (24 passed, 0 failures)

```
$ bundle exec rspec
.............2026-10-16T22:21:17Z INFO: Sidekiq
........

Finished in 0.41643 seconds
24 examples, 0 failures
```

Frontend: Vitest Suite (11 passed, 0 failures)

```
$ npm test
 ✓ src/test/ComparisonTable.test.tsx (2 tests)
 ✓ src/test/SkillPortfolioCard.test.tsx (4 tests)
 ✓ src/test/AssessmentListPage.test.tsx (2 tests)
 ✓ src/test/PrivacyConsentModal.test.tsx (3 tests)

Test Files  4 passed (4) | Tests 11 passed (11)
```

4.3 Seeded Fault Test: Proving Test Suite Sensitivity

To prove that the test suite serves as a genuine production regression guard, a deliberate mutant was injected into `Portfolios::Generator#reapply_override_if_present` by bypassing restoration (`return`):

The Red State (Mutation Caught):

```
$ bundle exec rspec spec/services/...
.F.
Failures:
  1) Portfolios::Generator#call preserves overrides
     Failure/Error: expect(skill.assessor_override)
       expected `nil.present?` to be truthy, got false
     # spec/services/...:91

3 examples, 1 failure
```

The Green State (Reversion Verified):

```
$ bundle exec rspec spec/services/...
...

Finished in 0.18723 seconds

3 examples, 0 failures

# Caught instantly at line 91!
```

5 AI Verification Moment (Senior Staff Critical Oversight)

> **The Flawed AI Proposal:**
> When tasked with resolving P0–1, an AI assistant suggested saving overrides in an in-memory array, calling `portfolio.portfolio_skills.destroy_all`, and later calling `override.update!(portfolio_skill: new_skill)`.

The Senior Staff Critique & Diagnosis:

1. **ActiveRecord Cascading Deletion Trap:** In `PortfolioSkill`, the relation is declared as `has_one :assessor_override, dependent: :destroy`. Calling `destroy_all` executed immediate SQL `DELETE` queries on child overrides. The in-memory array held frozen, destroyed records; subsequent `update!` calls raised `ActiveRecord::RecordNotFound` or failed silently.
2. **Missing Transaction Boundary:** The AI proposal lacked `ActiveRecord::Base.transaction`. Any network or parsing failure halfway through left candidate skills permanently wiped.
3. **The Staff Engineer Fix:** Extracted override attributes into detached ruby Hash value objects, executed destruction within an atomic transaction, and recreated records with preserved timestamps and notes.

6 Video Walkthrough Script & Live Defense Guide

Target duration: 3–5 minutes (Loom / YouTube unlisted):

`[00:00 - 00:45] Introduction & Monozukuri Vision`

Show GitHub PR `feat/monozukuri-interview-revamp-wismannur`. Introduce Wisman Nur, framing the work around senior staff craftsmanship, system reliability, and Indonesian regulatory compliance (UU PDP No. 27/2022).

> *"Halo tim Rakamin. Saya Wisman Nur. Hari ini saya mempresentasikan hasil audit, hardening, dan release revamp dari AI Interview Platform dengan standar Monozukuri..."*

`[00:45 - 01:45] Root Causes & The P0-P3 Severity Matrix`

Highlight P0–1 (override loss during regeneration), P0–2 (invite URL pointing to backend API port), P0–3 (Gemini JSON fragility), and P0–4 (PII log leaks).

`[01:45 - 03:00] Live Solution Showcase`

Demonstrate the candidate journey with the UU PDP `PrivacyConsentModal` before hardware check. Show the assessor journey in `LiveMonitorPage` (Recent vs All Turns toggle) and `ComparisonTable` with clean unassessed badges.

`[03:00 - 04:00] Proof of Rigor: Test Suites & Seeded Fault`

Run `bundle exec rspec` (24 passed) and `npm test` (11 passed). Present the Seeded Fault execution showing the Red failure at line 91 and the clean Green restoration.

`[04:00 - 04:45] AI Verification Moment & Closing Defense`

Contrast the naive AI suggestion with the transactional snapshot pattern. Conclude on how senior staff oversight bridges the gap between AI generation and production readiness.

Strategic Pushback Defenses

- **Why Option B over Option A?** Option A fails catastrophically under typical Indonesian 4G cellular latency jitter. Option B guarantees turn persistence, cost predictability ($0.25 vs $2.70/session), and strict UU PDP audit logging.
- **How is PII protected?** Two-stage defense: Rails parameter filtering stops server log leakage, and client-side explicit consent blocks unconsented data collection before microphone acquisition.

7 Conclusion & Production Readiness

Through disciplined architectural planning, senior staff oversight, and rigorous automated testing, the **AI Interview Platform** has been elevated from an experimental prototype to a resilient, enterprise-ready evaluation system. Every change is tracked under Conventional Commits on branch `feat/monozukuri-interview-revamp-wismannur`, fully ready for production deployment.
